

Class Structure

Description

This is a foundation course on learning modern C++ language (C++ 11 and beyond).

This course covers object-oriented programming using modern C++. Because most automation, embedded applications, gaming, and many large data processing applications are written in C++, it is essential that software developers understand and master it. Hardware engineers are increasingly using C++ and OOP in system verification tasks, and as of the current decade, there has been a noticeable shift from C to C++ on microcontroller systems.

This course offers an excellent foundation in developing optimized modern C++ applications. The participants will learn to write faster and modular code, and the debugging techniques, for real-world applications. There will be assignments and exercises to accompany the lectures.

Learning Outcomes

At the conclusion of the course, you should be able to:

- Modern C++ (post C++11)
- Apply object oriented concepts to software development problems using modern C++
- Understand and use the basic programming constructs of C++
- Manipulate various C++ data types, such as arrays, strings, and pointers
- Write C++ code using principles of object-oriented programming
- Understand design patterns in C++ using singleton pattern
- Manage memory appropriately, including proper allocation/deallocation procedures using unique and smart pointers
- Best practices (dos and don'ts)
- Utilize best practices from C++ GSL or Google Abseil libraries

1. Introduction

- Setup development environment
 - [Basics of Docker](#) and container management
- Review class structure
- Operating System Fundamentals: Linux, Mac, POSIX, RTOS
- Modern approach to "manpages"
 - [tldr](#)
 - [chatgpt](#)
- SSH and password-less login
- System Monitoring: `top`, `df`

- Homework: Operating Systems and POSIX

2. Basic Syntax & Functions

- Basics
 - Types, strings
 - Control structures
- Declare and define functions
 - Call by value, reference, pointer
 - Overloading
 - Default parameters

3. Object Oriented Basics

- Classes and objects
- Constructors and destructors
- Inheritance
- Rule of 3
- Introduction to `unique_ptr`

4. Operators & Templates

- **Operators** (=, [], *, -> etc.)
- **STL library containers**
 - Iterators
- **Templates** and the need for header only code

5. Midterm

- Review Questions
- Feedback
- Streams
- Chrono
- Exam

6. Object Oriented Advanced

- OO Inheritance
- Abstract classes
- Virtual and pure virtual functions
- Virtual destructors
- Polymorphism

7. Smart Pointers

- Unique pointer
- Shared pointer
- Weak pointer

8. More Advanced Topics

- Lambdas
 - How it can be used
- Concurrency
 - Threads
 - Mutexes
 - Condition Variables
- Deadlock Empire

9. Powerful Libraries

- Libraries
 - Boost
 - Guideline support library (GSL)
 - Abseil
- Design patterns
 - Singleton

10. Final Examination

- Review Questions
- Collect Feedback
- Exam

Revision #11
